

App Framework

Simplify app management

Custom building an app requires programming experts and talent. More than that, It is costly and takes longer.

Imagine building a custom database application, static website or content site in hours instead of years. That too Secured. Scalable.

Web 2 or web 3

On premise or cloud

Centralized or decentralized

No code solution

Decentralized and distributed app engine

- Website builder
- Relational database app builder
- Document app builder
- Document production
- Document template
- Web content builder
- Bulk email

- Identity management
- Access management
- Participant management
- Business process management
- Business activity management
- Rules engine

- Centralized or decentralized
- Web 2 & Web 3

Example

TruckMoon is truck management company with more than 150 employees and they want to build a custom solution to manage their trucks.

Scope of work: Capture basic Truck info, driver info, routes and trips. TruckMoon also wanted trip data to be in a ledger.

Users: 3 Truck admin user and 150 of employees and 3000 drivers

Step 1: TruckMoon took a custom build quote from a leading software development company. Software vendor proposed Java and Amazon as technologies, \$500,000 for development, \$100,000 onboarding and 10 months delivery time.

TruckMoon did not have the budget or patience to wait that longer. TruckMoon find us. We estimated 1 month delivery time, a dedicated environment. The solution will cost only a fraction.

TruckMoon logs into our system, create users, groups and roles. Create screens for entities like Truck and Driver. Utilize document, content, BRMS and BPM features to quickly rollout the product.

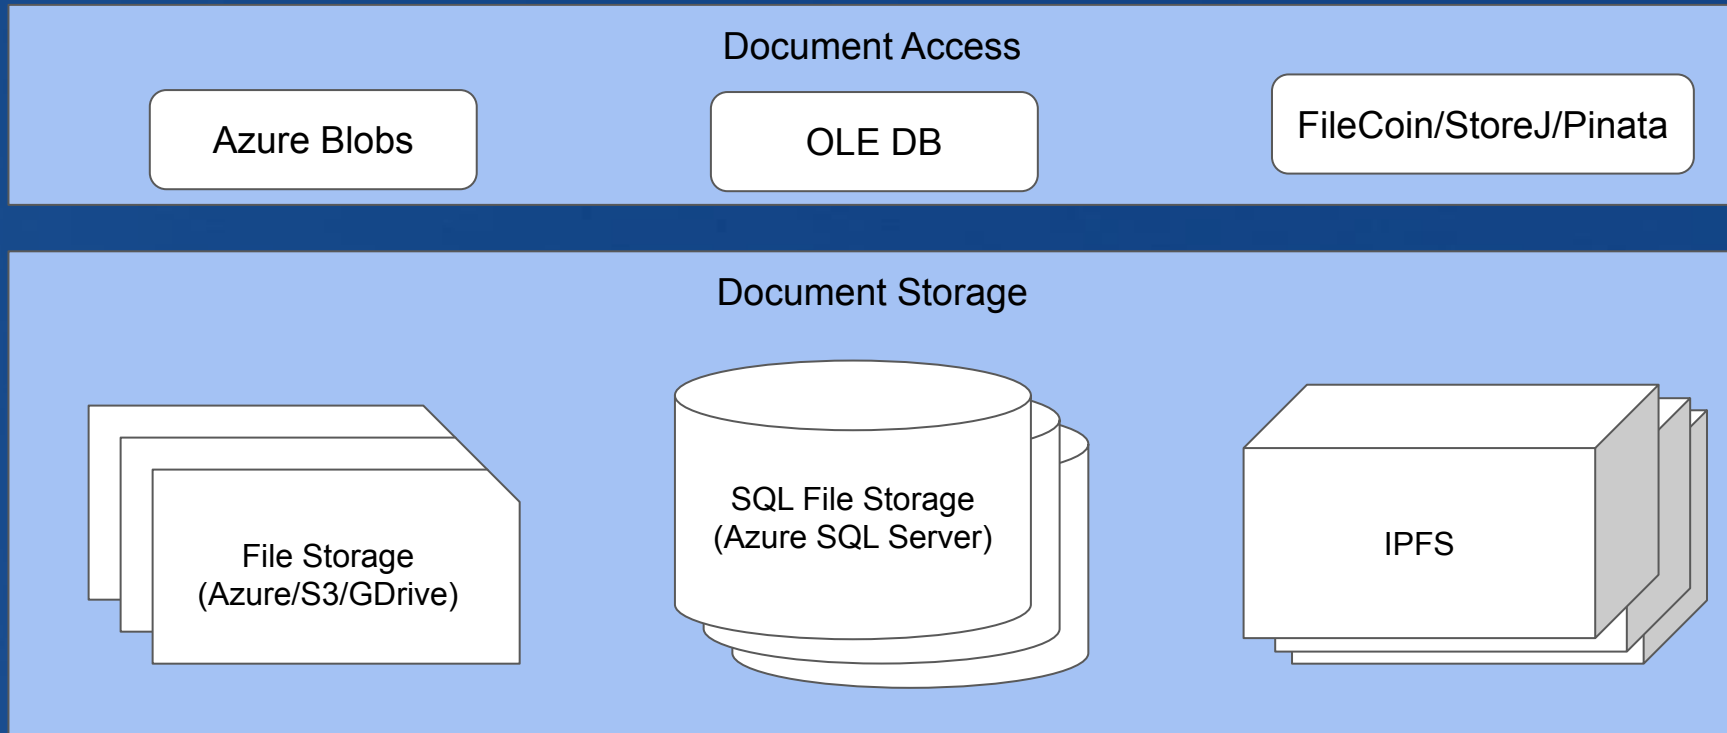

Sounds over simplified? - Let us see a demo

Trends

Development Trends

95% of apps has low admins

70% of functionality in every app can be categorized as simplex

Machine learning will replace 95% of coding by 2050

No-Code approaches in today's world is not machine learning friendly

Crypto Apps

1. Blockchain wallets - Manage (done)
 - a. Blockchain account model
2. Crypto transactions - Manage (done)
 - a. Payment model
3. Crypto transactions - metamask integration (in progress)
 - a. DID
4. Blockchain integration - Code-Gen Smart Contract
 - a. You entity will be converted into a smart contract and deployed
5. Crypto to credit
 - a. You app billing require a currency. A module

1. IPFS integration - documents (in progress)
 - a. Encrypted documents in blockchain
 - b. Public documents in blockchain
2. IPFS integration - source code
 - a. Your app source code in blockchain
 - b. App engine hash based on loaded code - distributed app execution model
3. IPFS integration - business contracts
 - a. Distributed contract signing model
4. IPFS - web content (in progress)
 - a. Imagine your static web site running from IPFS (Pinata)
